REPORT

Date Feb. 10 & 15/84

Film No. 5150 & 5171

Left Foot - Feb. 10/84

Position of the fracture at the base of the 5th metatarsal is anatomic within the cast. The films were sub-optimal with respect to assessing the persistence of the radiolucent fracture line.

[Redacted]

Left Foot - Feb. 15/84

Four views were obtained out of plaster. The fracture line of the base of the 5th metatarsal is still faintly evident but bony union across the fracture appears to have occurred. There is no significant deformity.

[Redacted] Radiologist.
